

Lyftman telescopic crane system!

Special Lyftman overhead steel crane system combined with a telescopic separate girder installed under the steel girder. Special fixed suspensions and moment-absorbing trolleys with extra wheels are used to create lifting balance when the girder is fully extended.

A telescopic design offer limitless possibilities to reach areas that would otherwise have not been able to reach due to various opticals. The optimal choice here due to limited space, low head room area and the need to ba able to reach and pick up gods inside pallet racks from both sides.

The system has a lock function making the two beams centered in the middle allowing the girder to move along the aisles without colliding with the pallet racks.

Sold to a large global truck manufacturer.
